ROOT CAUSE ANALYSIS · INC-4821

Database pool misconfiguration caused checkout failures

Sev2 Final · version 1

1 Incident overview

Incident ID	INC-4821
Severity	Sev2
Incident date	3 Nov 2026
Incident commander	ravi.kumar
Affected services	payments-api, checkout-web, payments-db
Document status	Final
Version	1
Prepared by	Asha Rao
Date prepared	12 Nov 2026

2 Executive summary

A misconfigured database pool size in deploy 2291 caused checkout failures for approximately 4,200 orders, impacting 30% of transactions across the payments-api, checkout-web, and payments-db services. The root cause was a typo that set the database pool maximum to 5 instead of 50, a value that was not validated by the continuous integration pipeline. The incident was resolved within one hour and five minutes by rolling back deploy 2291. Follow-up actions include adding schema validation for pool settings in CI, alerting on database connection saturation above 80%, and automatically linking deploy events to the incident channel.

3 Impact

The incident resulted in a 30% checkout failure rate, affecting approximately 4,200 orders. This disruption impacted the payments-api, checkout-web, and payments-db services, causing checkout failures for many users. The event was classified as Sev2 and lasted from 14:05 to 15:10, with a total resolution time of 1 hour and 5 minutes.

Customer impact	checkout failures for many users
Scale of impact	30% (≈4,200 orders)
Business or SLA impact	no SLA breach; 37 support tickets
Data loss or exposure	none
Duration	1 hour 5 minutes

4 Timeline

Milestone	Time as recorded	Time (UTC)
Incident start	2026-11-03 14:05	2026-11-03 08:35 UTC
Detected	2026-11-03 14:06	2026-11-03 08:36 UTC
Mitigated	2026-11-03 14:40	2026-11-03 09:10 UTC
Resolved	2026-11-03 15:10	2026-11-03 09:40 UTC

Times were recorded in IST, taken as Asia/Kolkata.

Time to detect: **1 minute** Time to mitigate: **35 minutes** Time to resolve: **1 hour 5 minutes**

2026-11-03 15:10	2026-11-03 09:40 UTC	Ravi reports all green for 30 min, closes incident, resolved at 15:10	ravi.kumar
2026-11-03 15:20	2026-11-03 09:50 UTC	Meera identifies root cause: config change set db pool max to 5 instead of 50	meera.i
2026-11-03 15:22	2026-11-03 09:52 UTC	Meera reports impact: 30% failures between 14:05-14:40, about 4,200 orders	meera.i
2026-11-03 15:25	2026-11-03 09:55 UTC	Ravi reports no SLA breach, inside error budget, 37 tickets	ravi.kumar
2026-11-03 15:30	2026-11-03 10:00 UTC	Ravi notes what went well: alert fast, rollback clean	ravi.kumar
2026-11-03 15:31	2026-11-03 10:01 UTC	Ravi notes what went badly: 10 min to connect deploy to errors, deploy channel noisy	ravi.kumar
2026-11-03 15:35	2026-11-03 10:05 UTC	Meera lists actions to prevent recurrence	meera.i

5 Detection

Detection of the incident occurred within one minute of the start, at 14:06, following user reports of 500 errors on the payments-api. A PagerDuty alert was generated during this period, although the high volume of noise in the deploy channel contributed to a delay in linking the deployment to the observed errors.

How it was detected	user reported 500 errors on payments-api
Monitoring gaps	deploy channel is too noisy, causing delay in linking deploy to errors

6 Response and resolution

The response was led by Ravi, who assumed incident command at 14:13 and classified the event as sev2. The team executed a rollback of deploy 2291, which was initiated at 14:25 and completed by 14:40, resulting in a drop in error rates and the recovery of checkout success. The incident was formally resolved at 15:10 after a period of stability, with a total time to mitigate of 35 minutes and a time to resolve of 1 hour 5 minutes.

Root cause identification followed the mitigation, with Meera determining at 15:20 that a configuration change in deploy 2291 had set the database pool maximum to 5 instead of 50. Although the deploy was linked to the errors, there was a 10-minute delay between the deployment at 14:03 and the identification of the deploy as the source of the issue at 14:22. The response was characterized by swift incident command and a clean rollback, with the team noting that the alerting was fast and the mitigation process was effective.

Mitigation steps	1. rolled back deploy 2291
Fix applied	rollback of deploy 2291
People and teams involved	• pri… • ravi.kumar • meera.i

7 Root cause analysis

The root cause of the incident was a typo in deploy 2291, which set the database pool maximum to 5 instead of the intended value of 50. This configuration error was compounded by the fact that the continuous integration process did not validate configuration values before deployment.

Trigger	config change in deploy 2291 that set db pool max to 5
Root cause	config change in deploy 2291 set db pool max to 5 instead of 50 (typo); CI doesn\'t validate config values
Contributing factors	• CI doesn\'t validate config values
5 Whys	*Not provided by the user (Asha Rao, 12 Nov 2026)*

8 Lessons learned

What went well

- alert fired fast and the rollback was clean

What went wrong

- took 10 min to connect the deploy to the errors due to noisy deploy channel

9 Corrective and preventive actions

#	Action	Type	Owner	Due date	Ticket
1	add schema validation for pool settings in config CI	—	meera	20 Nov	—
2	alert on db connection saturation > 80%	—	priya	27 Nov	—
3	link deploy events into the incident channel automatically	—	*Not provided by the user (Asha Rao, 12 Nov 2026)*	—	—
